AMENDMENTS TO THE CLAIMS

 (Currently amended) A method of forming an electrolyte layer comprising an electrolyte composition and a matrix polymer, the method comprising:

forming the matrix polymer by polymerization of a first compound having at least [[two]] three isocyanate groups and a second compound having at least two nucleophilic groups containing active hydrogen, said polymerization being performed after a precursor for the matrix polymer is brought into contact with a surface on which the electrolyte is to be formed;

wherein the electrolyte layer is formed between two electrodes.

- (Previously presented) The method according to Claim 1, wherein the electrolyte composition comprises a solvent to form a gel electrolyte.
- (Previously presented) The method according to Claim 1, wherein the electrolyte composition comprises no solvent to form a solid electrolyte.
- (Previously presented) The method according to Claim 1, wherein the electrolyte composition comprises an ionic liquid to form a gel electrolyte.
- (Previously presented) The method according to Claim 1, wherein the electrolyte composition comprises a redox couple.
- (Previously presented) The method according to Claim 5, wherein the redox couple is a combination of a halogen ion and a halide ion.
- (Previously presented) The method according to Claim 6, wherein a halogen portion of the redox couple is iodine.
- 8. (Currently amended) A photocell comprising: a semiconductor layer composed of

semiconductor particles carrying a dye and an electrolyte layer, the layers being provided between a counter electrode and an electrode formed on a surface of a substrate;

wherein the electrolyte layer has a redox couple, an electrolyte composition, and a matrix polymer; and

wherein the matrix polymer is a polymer formed by polymerization of a first compound having at least [[two]] three isocyanate groups and a second compound having at least two nucleophilic groups containing active hydrogen.

- (Original) The photocell according to Claim 8, wherein the substrate is a transparent 9. substrate.
- (Currently amended) A method for manufacturing a photocell comprising: 10. injecting a mixed solution between a counter electrode and an electrode formed on a surface of a substrate, the mixed solution containing a first compound having at least [[two]] three

isocyanate groups, a second compound having at least two nucleophilic groups containing active hydrogen, and an electrolyte composition having a redox couple; and

polymerizing the first compound and the second compound after the mixed solution is brought into contact with the electrode formed on the surface of the substrate.

- (Previously presented) The method for manufacturing a photocell, according to Claim 10, 11. further comprising forming a semiconductor layer, composed of semiconductor particles carrying a dye, between the electrode and the counter electrode.
- (Previously presented) The method for manufacturing a photocell, according to Claim 10, 12. wherein the polymerizing is performed in accordance with a Michael addition reaction.
- (Original) The method for manufacturing a photocell, according to Claim 10, wherein the 13. electrolyte composition has a redox couple.

14. (Currently amended) A method for manufacturing a photocell comprising: forming a semiconductor layer composed of semiconductor particles carrying a dye between a counter electrode and an electrode formed on a surface of a substrate;

applying a first compound having at least [[two]] https://documents.org/least-two-nucleophilic groups containing active hydrogen; and polymerizing the first compound and the second compound.
